Name of the Guide		Dr J KAVITHA REDDY

Abstract

The AI-Based Attendance & Student Risk Prediction System is an intelligent web-based application designed to help educational institutions monitor student attendance and academic performance. Traditional attendance systems mainly store attendance records and do not provide early identification of students who may face academic difficulties. This system combines attendance management, academic performance analysis, and Machine Learning to identify students who require additional attention.

The system provides separate modules for Students, Faculty, and Administrators. Faculty can manage attendance and academic records, students can view their attendance, performance, risk status, and recommendations, while administrators can manage users, courses, subjects, and institutional policies. The system analyzes factors such as attendance percentage, academic marks, assignment performance, consecutive absences, and performance trends to classify students into Low, Medium, or High Risk categories.

The system follows an adaptive approach in which the student's risk level is automatically updated whenever new attendance or academic data is available. It provides early warnings, identifies the factors contributing to student risk, and supports faculty intervention through personalized recommendations and monitoring. The project can be developed using React.js, Java Spring Boot, MySQL, Python, and Scikit-learn, providing a scalable and intelligent solution for improving student monitoring and enabling timely academic intervention.
